

BEHAVIORDATA PSYCHODIAGNOSTIC

LABORATORY REPORT

Account: 005093

Subject: 55

Date: 02/17/09

Inventory: MMPI-2™

Report: 06

Options: RO,RE

Sex: Male

Age: 52

This is a short clinical report for psychodiagnosis. It is sent only to professionals who are licensed for the independent practice of psychodiagnosis and psychotherapy.

This report from Behaviordata Incorporated is based on the system that was designed by Joseph C. Finney, M.D., Ph.D., a psychiatrist and a clinical psychologist at the University of Kentucky, with the help of research grants from the National Institute of Mental Health and U.S. Vocational Rehabilitation Administration.

Analysis of this kind can be done from various psychological inventories or from other information. Like any other report based on an inventory, this is subject to error. No decision should be made from this report alone, but only from consideration of the case history and all the available evidence. In this case, the inventory completed and submitted for analysis was the Minnesota Multiphasic Personality Inventory-2(tm) (MMPI-2tm), the trademarks and copyrights of which are owned by the Regents of the University of Minnesota. The University and its licensee, NCS Pearson, Inc. (NCS), do not license, sponsor, or endorse Behaviordata's modified scoring and interpretive system or any reports resulting from it.

Behaviordata has purchased from NCS the MMPI-2(tm) Basic Service Profile Report, reformatted by permission on page 2 which provides standard MMPI-2(tm) test raw and T scores. The remainder of Behaviordata's report, including the Profile on page 3, contains re-analyzed and changed raw and T scores based on the University of Kentucky's Interpretive System developed by J. Finney (JF). Behaviordata's re-analyzed and changed scores are indicated by the addition of "-JF" to the scale name throughout the Behaviordata report.

The raw scores reported on this page were obtained by changing the standard MMPI-2™ test raw scores by reducing the factor of anxiety or social desirability and the effects of response set for the rare (possibly random) answers.

The T-scores reported on this page are not the standard MMPI-2 T scores. These are the T-scores normalized by the University of Kentucky's Interpretive System, developed by J. Finney, M.D., Ph.D., on a sample of 2000 men and women.

The Mf score is based on scores by subjects of the same sex as this subject.

The following narrative statements are based on the University of Kentucky's Interpretive System developed by J. Finney, M.D., Ph.D. (JF) and distributed by Behaviordata, Inc.

He does not give a consistently favorable nor a consistently unfavorable picture of himself. He tells us some positive things and some negative things about himself.

His test profile is one that is not at all typical of clients seen by psychiatrists and by clinical psychologists. He is less anxious or upset than are most patients.

He has chronic emotional problems. They may not be acute now, but they can be expected to keep troubling him indefinitely. His overall balance of mental health is poor. The long-term outlook for him is not good.

He is a flexible, obliging, and contented person; or else he has gone to great lengths to give that impression. He adjusts to people. He listens to people, and he lets them influence him. He is eager to please people, and he finds it hard to say no to people.

He generally tries to go along with what other people want. If a conflict arises, he yields, and he gives in to the other party. He would rather give in than have a quarrel. Because he is so flexible and adaptable, he is a changeable and unpredictable person. He adjusts to whatever situation he finds himself in.

He can be a calmly hostile person: a resentful person who nonetheless feels satisfied with himself. He is one of those people who seem to take a dislike to many other people rather easily. Things that people do seem to annoy him, arouse his resentment, or make him angry. Although he may dislike people, he is not afraid of them and does not feel threatened by them. He feels confident of his ability to deal with them or bypass them in one way or another.

He claims to be in no distress. He is not asking for help. Indeed, he denies any need for help. He may be rather defensive about it; he will probably be annoyed if anyone suggests to him that he has any personality problems. His attitude is that there is nothing wrong with him, but that something may be wrong with certain other people he knows. He feels quite able to take care of himself. And from all that we can see of him here, he seems to be the kind of person who can make a fair success of life, even though he may conflict with some people and rub some people the wrong way.

He can be a very capable and industrious person, efficient, and hard-working. He can be a good leader in every way. He can be warmhearted, friendly, and sociable. He seeks responsibility, and he goes out of his way to undertake it. He takes responsibility on, and he carries it out well. He appears to be active, enterprising, bright, and resourceful. He doesn't always do things in the conventional way. He gets good ideas spontaneously, ideas that can benefit the whole group. His thinking is well organized. He analyzes the issues, he grasps the key points, and he sees what needs to be done. He makes decisions quickly, he makes plans, and he stays with them, doing a thorough and systematic job. He speaks well, and he usually persuades people to go along with him. He tries to deal with people fairly and ethically. He can be trusted to use his authority not selfishly but for the benefit of everybody in the group. He looks after those over whom he has authority and takes good care of them.

At his best, he is cooperative, pleasant, and generous.

But he can be moody. When a situation puts pressure on him, he is likely to become discouraged, anxious,

Account 005093 Subject 55 [Male,52]

upset, and exhausted. He may take more responsibility on than he can cope with.

He is not at all mentally ill; that is, not at all psychotic. He shows no tendency toward psychosis at all.

He can be a somewhat hostile person.

He appears to be a conscientious, responsible, and trustworthy person. He tries to be careful to deal fairly with people and to respect their rights.

---- DIAGNOSTIC IMPRESSION ----

Assigning a diagnosis should never be attempted on the basis of psychological test results alone, nor from automated narrative reports generated from such findings. Rather, diagnostic conclusions should derive from a variety of informational sources, including detailed history, direct observation, clinical interview, the review of available clinical records, and test results. Diagnosis should also take into account factors such as any medical condition or injury, disability, trauma, or situational stresses that might affect this person's test performance.

Insofar as we can judge from our analysis of the psychological testing alone, the diagnosis most likely to fit this person best is:

Dependent personality disorder, with histrionic, dysthymic, and extroversive behavior, in a dramatically depressed mood, coded on Axis II. Histrionic "suicide attempts" are common, but death is rare.

Other diagnoses which may be worth considering are as follows; they are ordered according to the likelihood of application to this subject, regardless of whether they fall on Axis I or Axis II:

Histrionic personality disorder, with compulsive features. Coded on Axis II. These people use a mixture of relatively normal defense mechanisms. There is some possibility of hysterical acting-out.

No psychiatric diagnosis. This individual falls within normal limits.

Diagnosis deferred. Questionable validity of test. Despite anything else that may show up, people in this group show some signs that they may have distorted their answers in the direction of looking good. For this reason, we cannot put the usual degree of confidence in the findings.

Adjustment disorder, reaction to situational stress, with a dramatically depressed mood. Histrionic "suicide attempts" are common, but death is rare. Axis I. This can also be with mixed emotional features, or with mixed disturbance of emotions and conduct.

He is not a candidate for intensive psychotherapy of the kind that aims at self-understanding and analysis. If treatment is needed, it should be problem-focused.

He is not looking for therapy or counseling at this time.

The following analysis is based on the University of Kentucky's Interpretive System developed by J. Finney, M.D., Ph.D., (JF) and distributed by Behaviordata, Inc.

Account 005093 Subject 55 [Male,52]

The raw scores for scales L-jf, F-jf, K-jf, Hs-jf, HsK-jf, D-jf, Hy-jf, Pd-jf, PdK-jf, Mfm-jf or Mff-jf, Pa-jf, Pt-jf, PtK-jf, Sc-jf, ScK-jf, Ma-jf, MaK-jf, and Si-jf reported on these Scale Information pages were obtained by changing the standard MMPI-2™ test raw scores by reducing the factor of anxiety or social desirability and the effects of response set for rare (possibly random) answers.

The T-scores for scales L-jf, F-jf, K-jf, Hs-jf, HsK-jf, D-jf, Hy-jf, Pd-jf, PdK-jf, Mfm-jf or Mff-jf, Pa-jf, Pt-jf, PtK-jf, Sc-jf, ScK-jf, Ma-jf, MaK-jf, and Si-jf reported on these Scale Information pages are not the standard MMPI-2™ test T-Scores. These are the scores normalized by the University of Kentucky's Interpretive System developed by J. Finney, M.D., Ph.D., on a sample of 2000 men and women.

All Rights are Reserved.

The simple T-scores given in the report are the true normalized scores developed by Joseph C. Finney, M.D., Ph.D., at the University of Kentucky. This is the only standardization of the MMPI that was sponsored by a research grant from the National Institute of Mental Health.

AT, FAT, and TFAT scores are computed to reduce effects of response sets correlated with the A factor and the F scale.
